

DATA EMBASSY OF ESTONIA

PRESENTED BY NUTAN THAKUR

e-Estonia

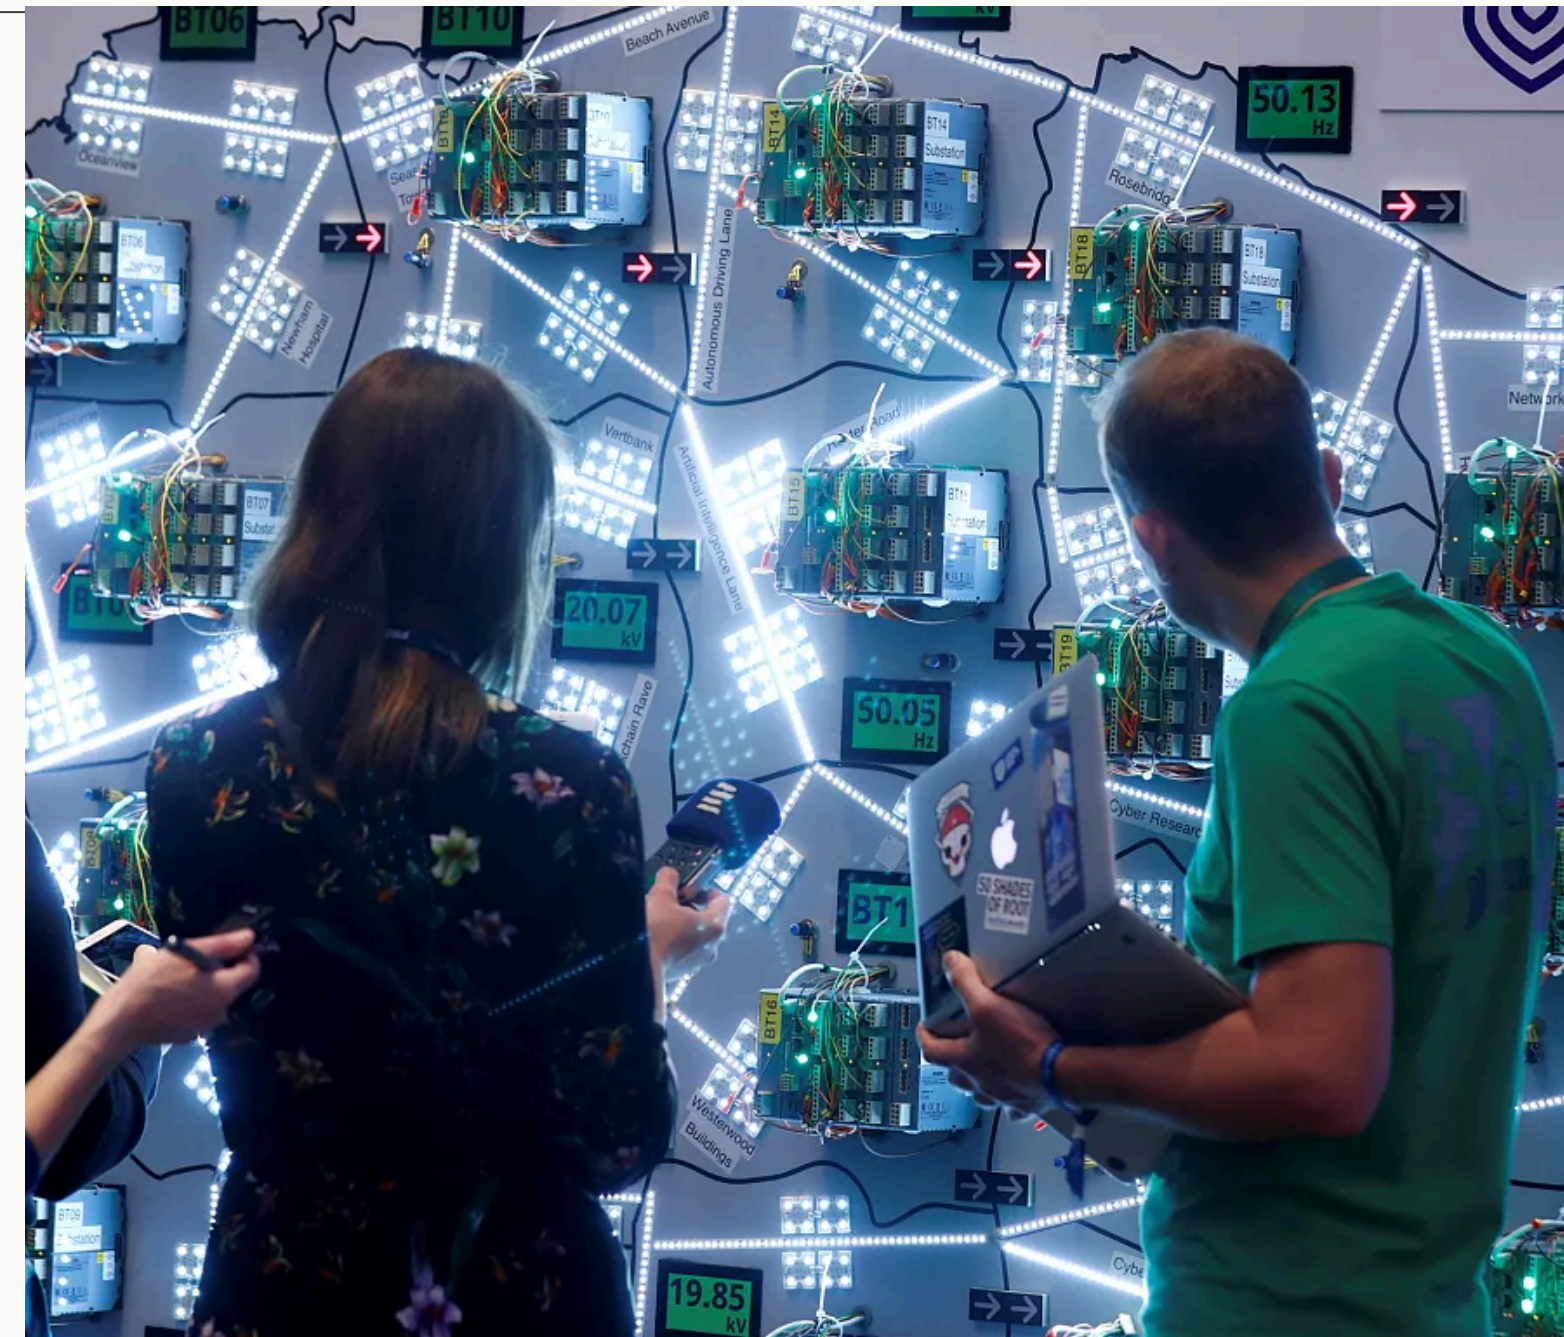

INTRODUCTION

1. Estonia is one of the most digitally advanced countries in the world.
2. Almost all government services are online (e-government).
3. To protect its digital data, Estonia introduced the concept of Data Embassy.
4. A Data Embassy is a secure data center located in a foreign country but legally considered part of Estonia.

WHY ESTONIA NEEDED A DATA EMBASSY?

- Estonia faced major cyber attacks in 2007, which showed risks to digital systems.
- Natural disasters, war, or cyber attacks could damage national data.
- Government data like population records, land records, and tax data are very important.
- To ensure digital continuity and national security, Estonia created Data Embassies.

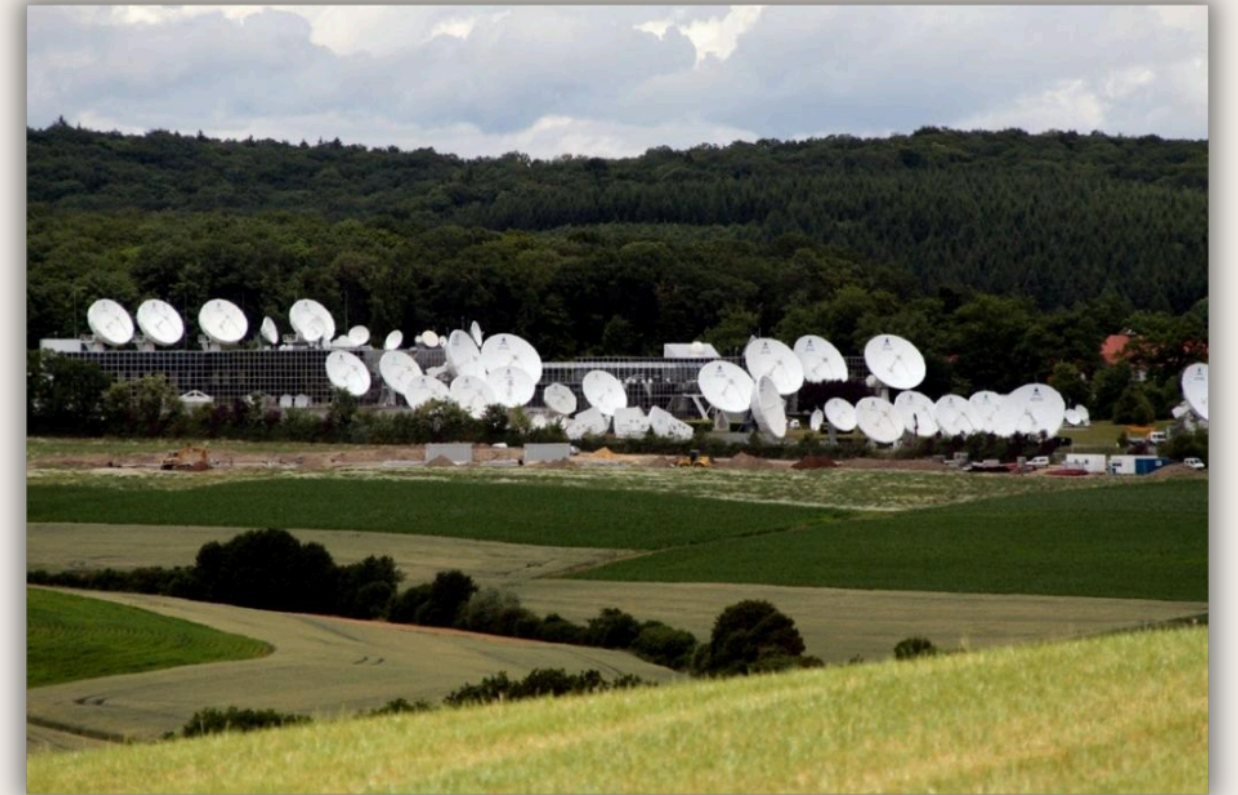

WHAT IS A DATA EMBASSY?

- A Data Embassy is a secure server facility located abroad.
- It stores critical government data of Estonia.
- Though located in another country, it follows Estonian law.
- First Data Embassy of Estonia was established in Luxembourg.

HOW DATA EMBASSY WORKS

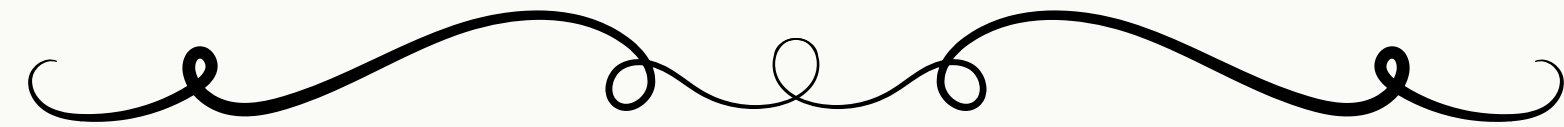

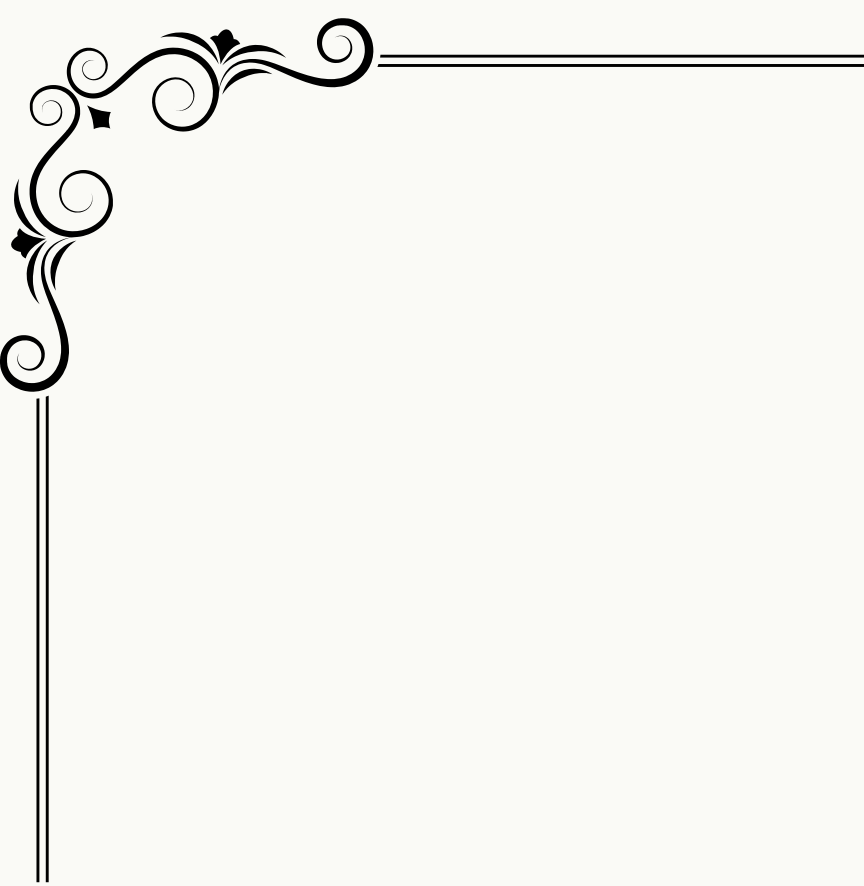

- Government data is continuously backed up to the Data Embassy.
- If systems in Estonia fail, services can be run from the Data Embassy.
- High-level cybersecurity and encryption are used.
- Only authorized Estonian officials can access the data.

IMPORTANCE AND GLOBAL SIGNIFICANCE

- Ensures data safety, sovereignty, and continuity of government services.
- Builds trust in digital governance.
- A model for other digital countries.
- Useful example for countries like Nepal as digital governance increases.

THANK YOU!!
