- Estonia is a small country in Northern Europe, near the Baltic Sea.
- The capital city is Tallinn.
- Estonia is known as one of the most digital countries in the world.
- E-Governance started in the late 1990s.
- The government created digital ID cards for all citizens.
- Today more than 99% public services are available online.
- People can vote, pay tax, sign documents, and get services digitally.

Estonia and History of E-Governance

- E-Police is a digital system used by police officers in Estonia.
- Police cars have tablets and online systems.
- Officers can check citizen ID, vehicle number, and criminal records instantly.
- Reports are filled digitally with real-time data.
- Information moves fast between police stations.
- This helps in quick decision making and faster response.

E-Police System and Its Workflow

- Traffic checks done using digital ID and vehicle database.
- Officers can see criminal history quickly.
- Missing person alerts shared instantly.
- Online reporting reduces paperwork.

Examples and Impact in Crime Prevention

- **Features:**

- Digital ID search
- Online vehicle and driver database
- Real-time reports
- Fast communication between units

- **Advantages:**

- Saves time and cost
- Less paperwork
- Better accuracy
- Faster crime reaction

- **Limitations:**

- Needs strong internet
- Cyber-security risks
- High maintenance cost
- Technology training required

Features, Advantages, Limitations

- The E-Police system of Estonia shows how digital technology can make policing faster, smarter, and more reliable. With real-time data, online records, and quick communication, police officers can respond to problems and crimes more effectively. It reduces paperwork and helps officers make better decisions on the spot. Although the system needs strong internet and good cyber-security, its overall impact is positive. Estonia has proven that digital policing can improve safety and build trust between people and the government.

Conclusion
